

Future of food and agriculture from macro to nano: opportunities and challenges

Carmen L. Gomes

Mechanical Engineering, Iowa State University

carmen@iastate.edu

This webinar is hosted by:

The Nanotechnology Application and Career Knowledge (NACK) Resource Center is a National Science Foundation (NSF) Advanced Technology Education (ATE) Regional Center for Nanofabrication Manufacturing Education. NACK is a subsidiary of the Center for Nanotechnology Education and Utilization (CNEU) in the Penn State College of Engineering's department of Engineering Science and Mechanics.

DUE 2000725

This webinar is being recorded and links will be available at <https://www.cneu.psu.edu/news/> and <http://www.nano4me.org/webinars>.

Please use the Q&A module for questions related to the webinar topic.

Technical questions (i.e. issues with the webinar controls, etc.) may be put in the chat window.

A Shared Vision of the Future

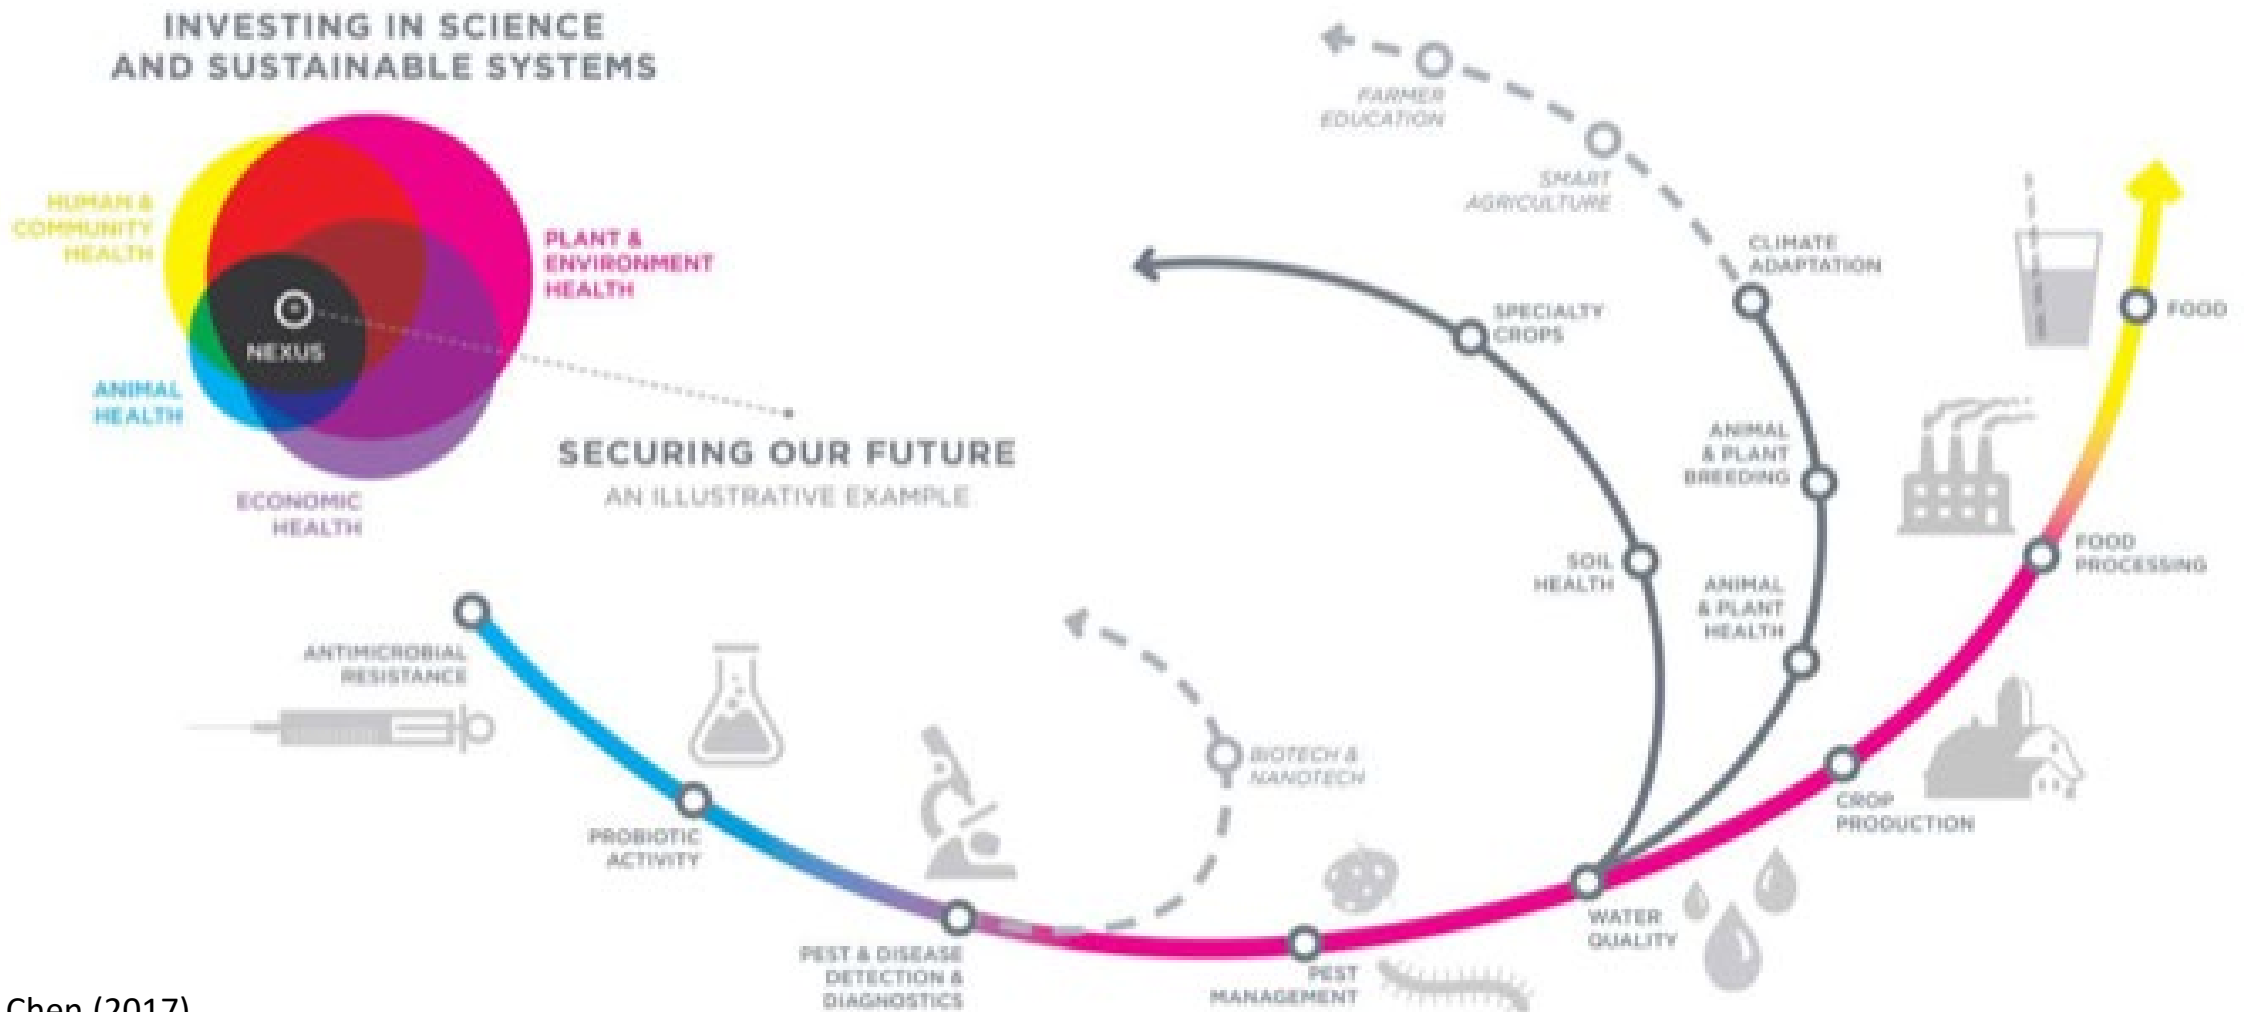

SUSTAINABLE DEVELOPMENT GOALS

- End hunger
- Achieve food security and improved nutrition
- Promote sustainable agriculture

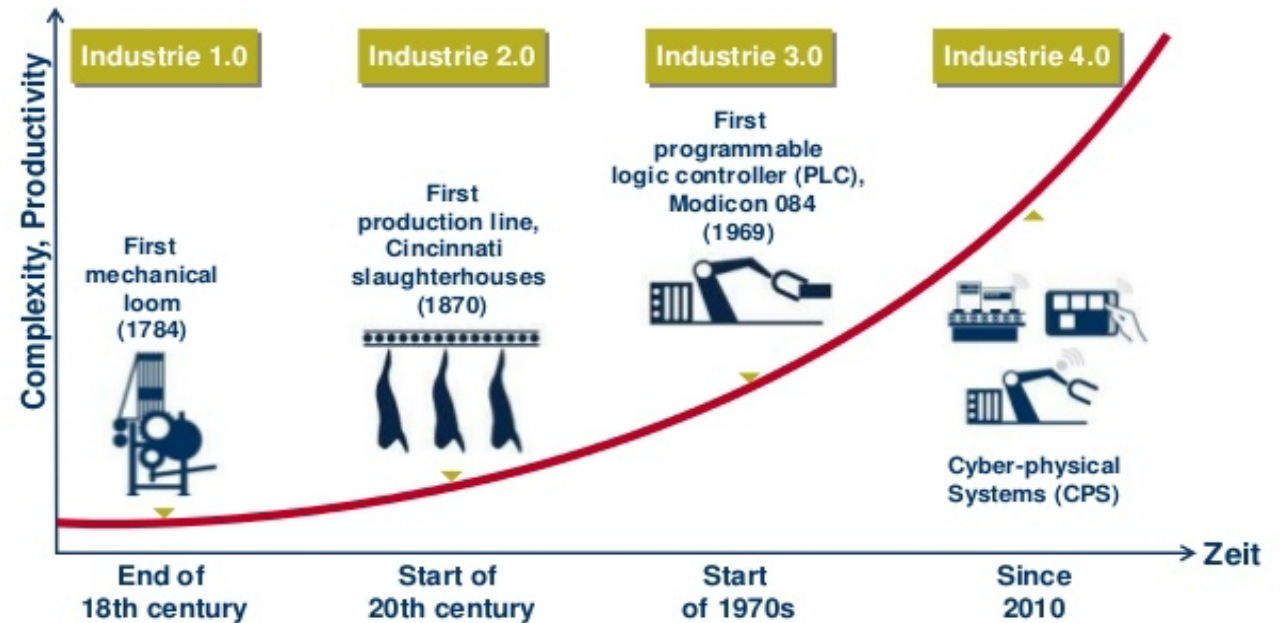

THE NEXUS OF AGRICULTURE AND HEALTH

MINDSET FOR the 4TH INDUSTRIAL REVOLUTION

Think **Systems**, not Technologies
Empowering, not Determining
By **Design**, not by Default
Values as a feature, not a Bug
Connecting the dots

Industrie 4.0: The next Industrial Revolution

Hierarchy of Needs as A Connected Playbook

A large pile of food waste, including various fruits and vegetables, with the text "FOOD WASTE" overlaid in the center. The waste includes green and red tomatoes, yellow and orange fruits, and other produce, all mixed together in a dark, shadowed environment.

FOOD WASTE

Focus on
the Biggest

Reduce Food Waste

30% CEREALS FOOD LOSSES
In industrialized countries, consumers throw away 286 million tonnes of

20% DAIRY FOOD LOSSES
In Europe alone, 29 million tonnes of dairy products are lost or wasted every year.

35% FISH & SEAFOOD FOOD LOSSES
8% of fish caught globally is thrown back into the sea. In most cases they are dead, dying or badly damaged.

45% FRUIT & VEGETABLES FOOD LOSSES
Along with roots and tubers, fruit and vegetables have the highest wastage rates of any food products; almost half of all the fruit and vegetables produced are wasted.

20% MEAT FOOD LOSSES
Of the 243 million tonnes of meat produced globally, over 20% is lost or wasted.

20% OILSEEDS & PULSES FOOD LOSSES
Every year, 22% of the global production of oilseeds and pulses is lost or wasted.

45% ROOTS & TUBERS FOOD LOSSES
In North America & Oceania alone, 5 814 000 tonnes of roots and tubers are wasted at the consumption stage alone.

REFRAME

break the bottlenecks ... shift the paradigms

Macro System Thinking: Problems to Solve

Detect, Control & Connect

- Spoilage detection
- Pathogen detection
- Biomarkers for Health
- Supply-chain traceability
- Food Distribution Disruptions

Preserve & Expand Use

- Safe and effective preservation
- Sustainable packaging and preservation
- Reduce packaging use while preserving food
- New use for food waste
- Waste less
- Use all parts of plant
- More plant-based

Understand

- Food degradation mechanisms
- The psychological aspect of eating
- Oral Processing of Food
- Food-Health interaction
- Distresses due to food (allergens and intolerance)

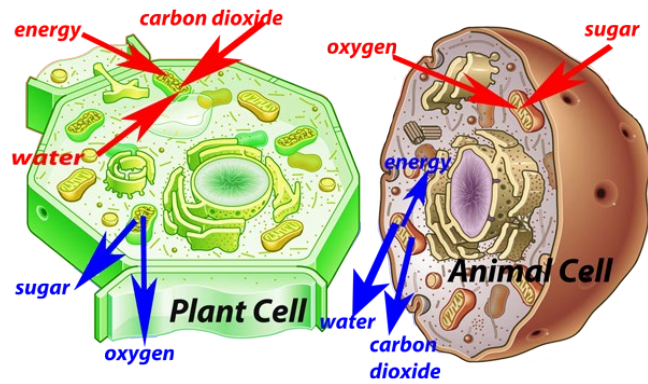

Deliver Health & Joy

- Food structure manipulation
- Food structure preservation
- Macromolecular interaction
- Encapsulation and release of bioactives
- Tailored release kinetics
- Minimally processed safe food

Safe & Consumer Accepted

- Education for Safety
- Education for Biology and Biotech
- Safety of new materials
- Safety of new technologies
- Ecosystem view of technologies & interactions

Shift to Nano: To Find and Change Bottlenecks

Food, Environmental, and Agricultural Sensing Technologies innovations needed

- integrated sample preparation
- label-free or direct detection in complex matrices
- long-term sensor stability
- development of low-cost and user-friendly devices
- integrate new mobile robotic sensing platforms (e.g., UAV)
- detailed analysis of complex matrices
- biosensors that have viable pathways for commercialization
- **use-inspired sensor design**
- **consider the triple bottom line:** economic, environmental and social values
- **tools that can support interoperability**
- New material arrangement and architecture
- **biodegradable** materials

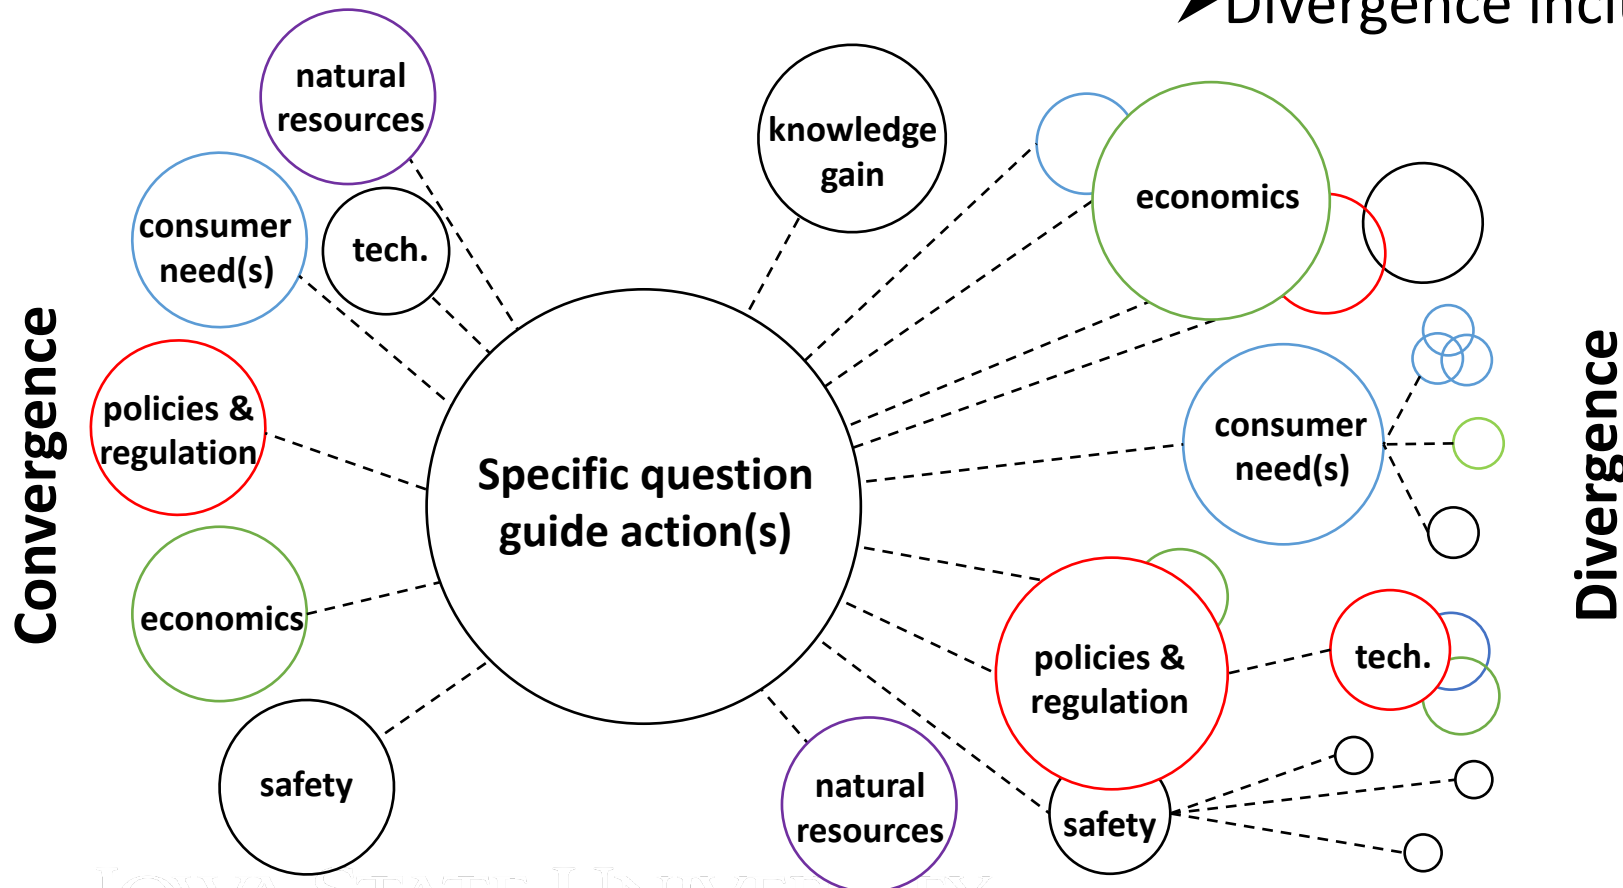

Questions ??

Convergence science is our roadmap

➤ Trans-disciplinary questions drive ideation

➤ Key players converge to address individual challenges

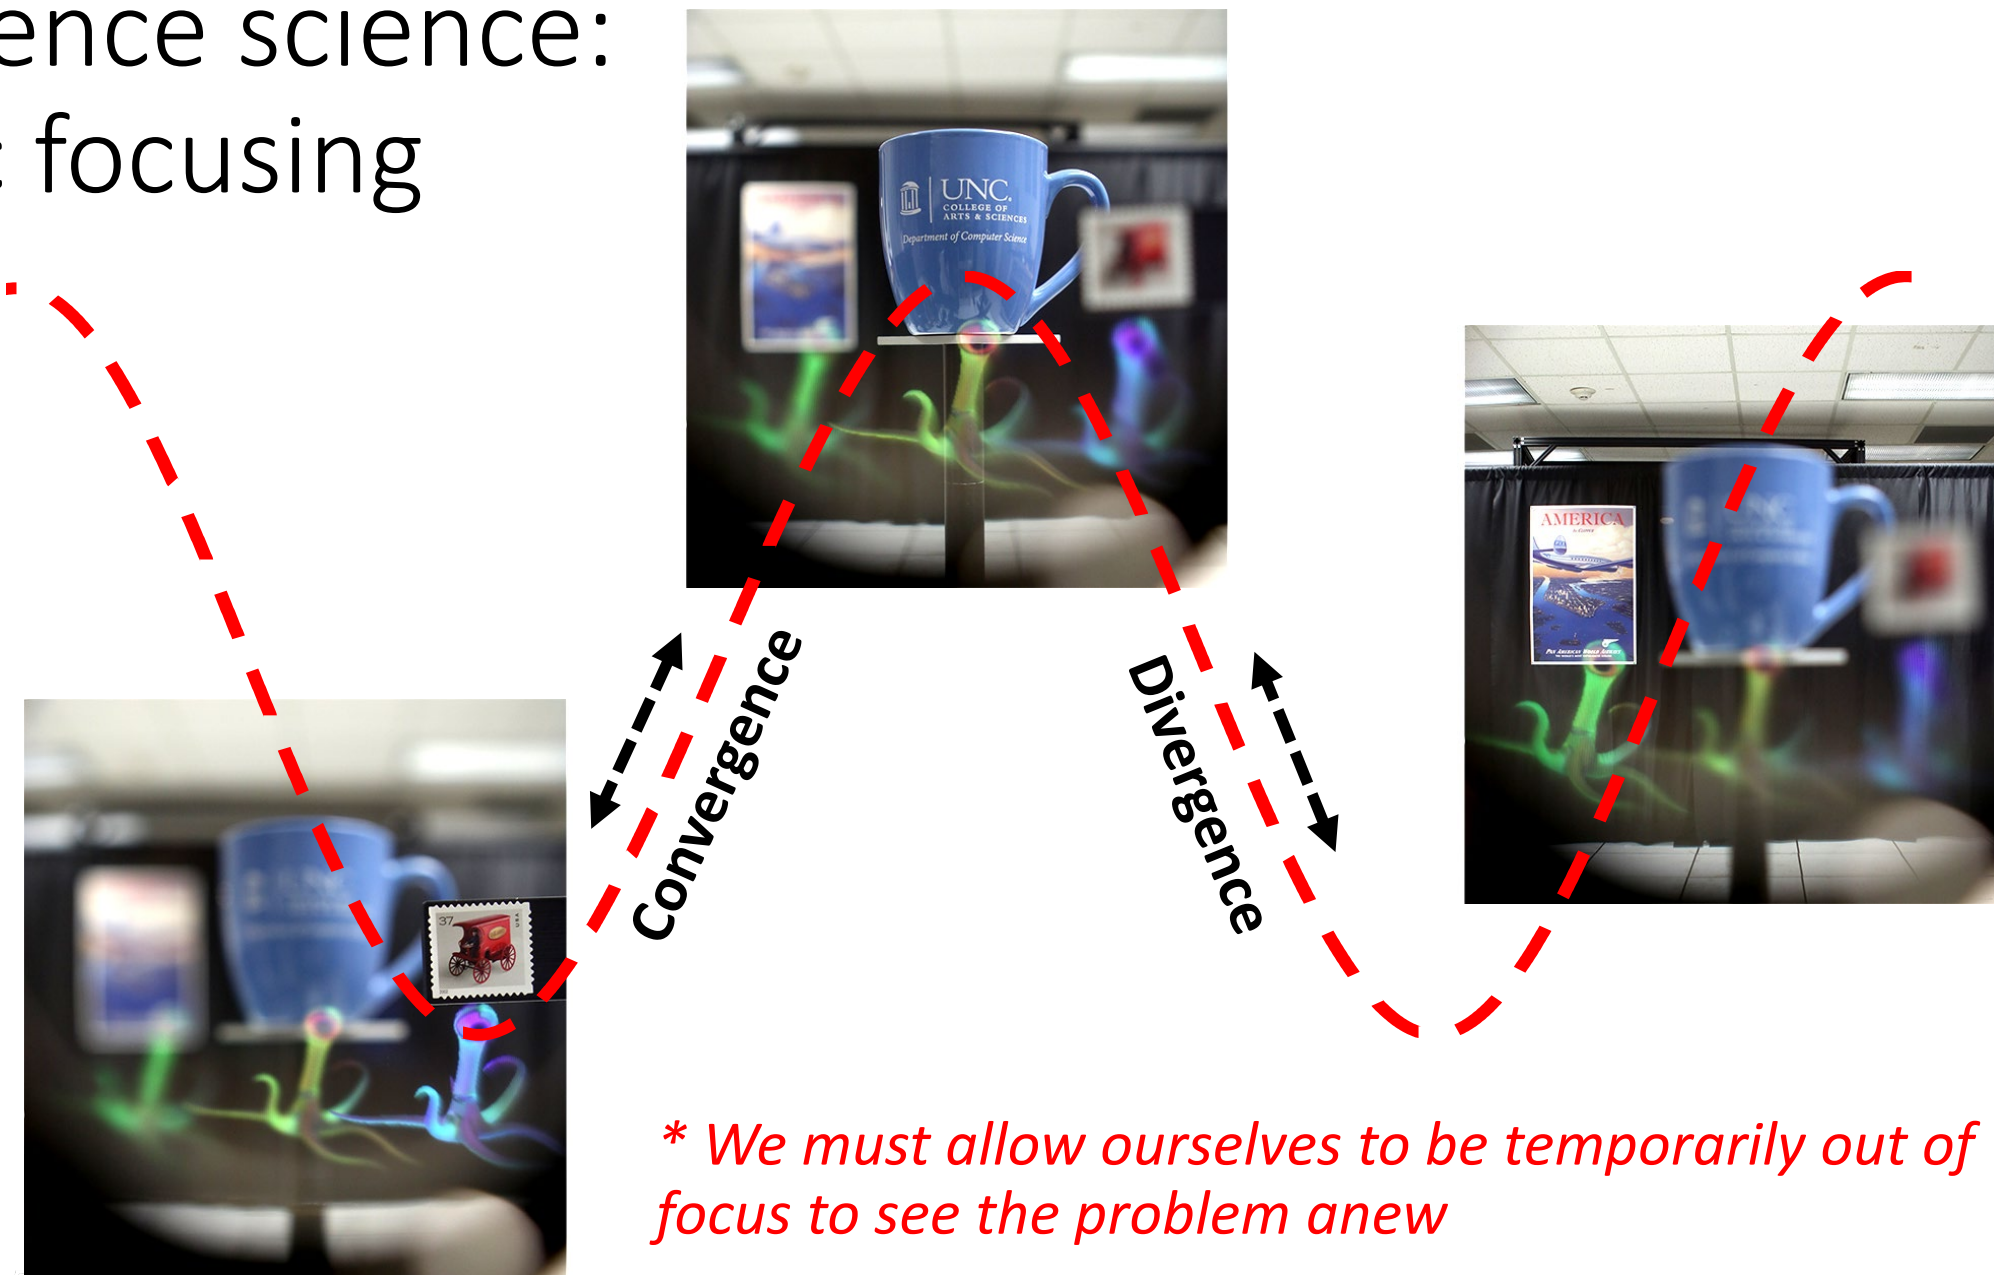

➤ Divergence includes spin-off products and ideas

** We may not need to understand all the connections amongst the pieces of the puzzle*

Convergence science: Dynamic focusing

How Can we Meet the Food Security, Safety, and Sovereignty Needs of Low-Income Communities?

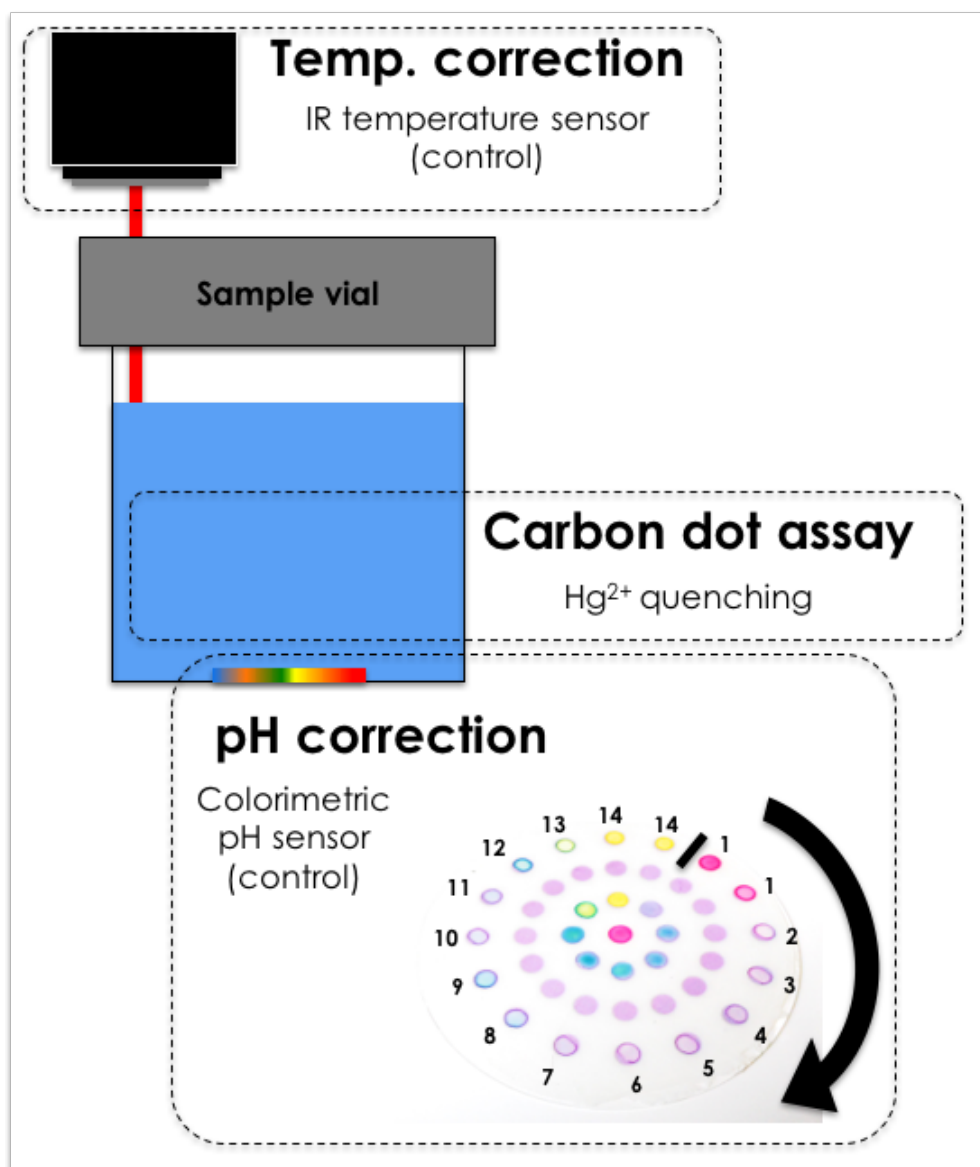

Stories of convergence in Colombia by Prof. Diana
Vanegas at Clemson

Hackers space for nanotech tools in low-income settings

- ▶ Using a low cost (\$60) millisecond pulsed laser, we have tuned the method for rapid fabrication of low cost conductive plastics.

Correcting for pH and temperature

$\text{Hg}^{2+} = 0$ ppb

T=25 C

Blank

pH=7

$\text{Hg}^{2+} = 50$ ppb

T=25 C

+ sample

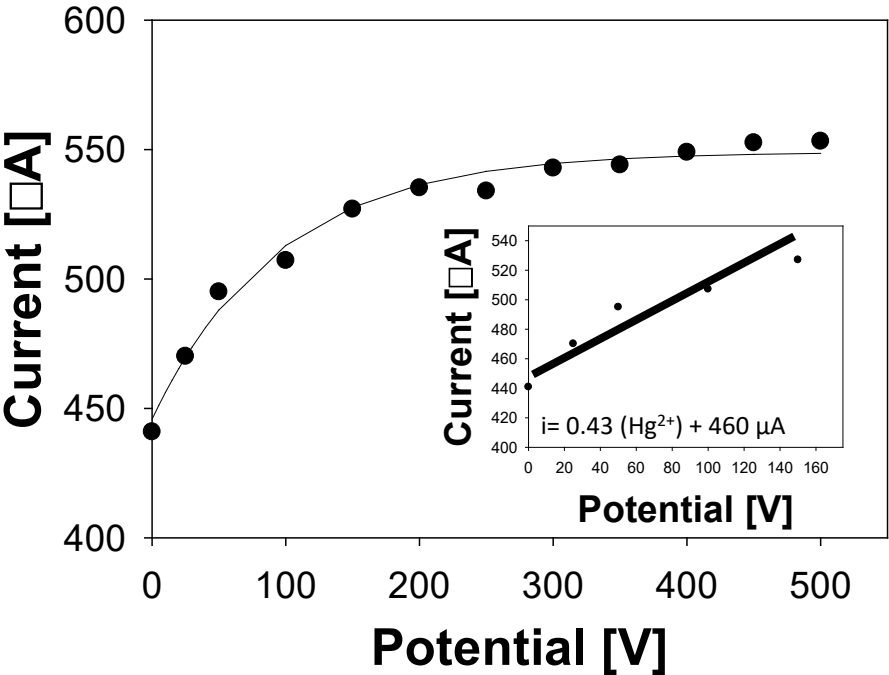

pH=6

** Currently working on a post hoc algorithm that will process images and temp data*

Handheld signal acquisition and mobile phone app

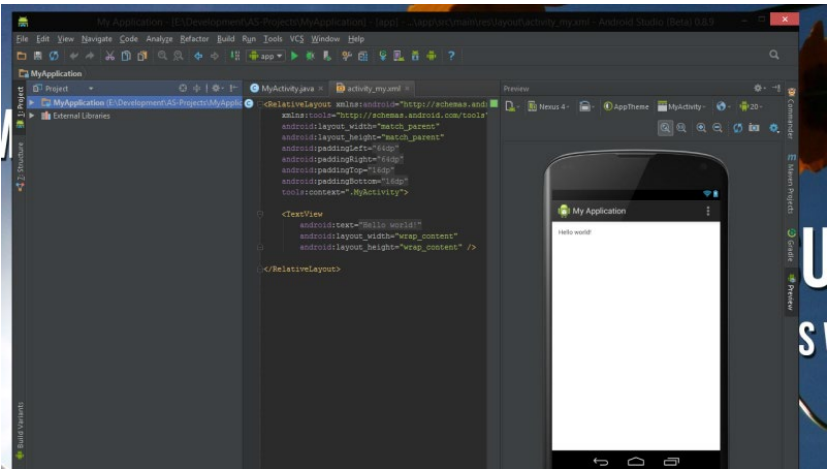

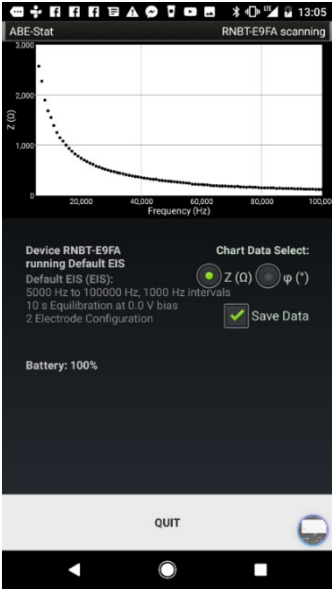

- ▶ Nanosensor performance

- LOD = 1.2 $\mu\text{g/L}$ (ppb)
- Sens. = 0.43 $\mu\text{A}/[\text{Hg}^{2+}]$
- Linear range = 1-200 $\mu\text{g/L}$ (ppb)

- ▶ Currently testing electrodes with smartphone potentiostat

- Creating mobile apps, cybersecurity infrastructure

Nanotechnology-based tools for food and water safety in low-income communities... Definitely possible!

The cover of the journal *biosensors* features a green background with a faint DNA helix. At the top left is the journal logo, and at the top right are two circular badges: one for 'ISI Web of Science' and another for 'CITESCORE 3.59 SCOPUS'. The central focus is a comparison between 'Analytical grade materials' and 'Locally sourced materials'. The 'Analytical grade materials' section includes a chemical structure diagram with labels for CNC, DMU, and CuSO₄, and a photograph of a yellow, porous material. The 'Locally sourced materials' section includes a chemical structure diagram with labels for MnO₂, starch, DAO, and MnCl₂, and a photograph of a yellow, porous material. A hand is shown holding a yellow ring-shaped sensor. Below these images is a photograph of a grey, textured surface labeled 'Laser scribed graphene'. The main title of the article is 'Laser Scribed Graphene Biosensor for Detection of Biogenic Amines in Food Samples Using Locally Sourced Materials'. At the bottom, it indicates 'Volume 8 · Issue 2 | June 2018' and the MDPI logo with the website 'mdpi.com/journal/biosensors' and ISSN '2079-6374'.

The cover of the journal *ACS SENSORS* features a dark blue background with a glowing purple, branching structure resembling a coral or a sensor array. A red laser beam is directed at the structure. The title 'ACS SENSORS' is prominently displayed in white. At the top, it says 'JULY 2018 VOLUME 1 NUMBER 7 pub.acs.org/acsensors'. The ACS Publications logo is at the bottom left, with the tagline 'Most Trusted. Most Cited. Most Read.' and the website 'www.acs.org' at the bottom right.

Water Filtration Using Plant Xylem from Karnik lab at MIT

Filter construction (Eastern White Pine)

cut branch

peel off bark

fasten into tube

xylem filter

Water permeation

Cross-section after filtration

Ink filtered by top 2-3 mm, consistent with conduit length

Filtration of bacteria from Karnik lab at MIT

- Fluorescently labeled inactivated *E. coli* (~1 μm)

- *E. coli* were filtered within the top 2 – 3 mm of filter
- Hemacytometry showed **> 99.99% rejection** of *E. coli*
- 6 mm-long filter shows perfect rejection of 1 μm particles

Point-of-use water sensors from Karnik lab at MIT

- Findings from fieldwork in India
- Current infrastructure is unable to test many trace pollutants of concern
 - Limited instrumentation at local labs
 - Inaccurate or nonexistent field test kits[1]
 - Difficulty sending samples to central labs

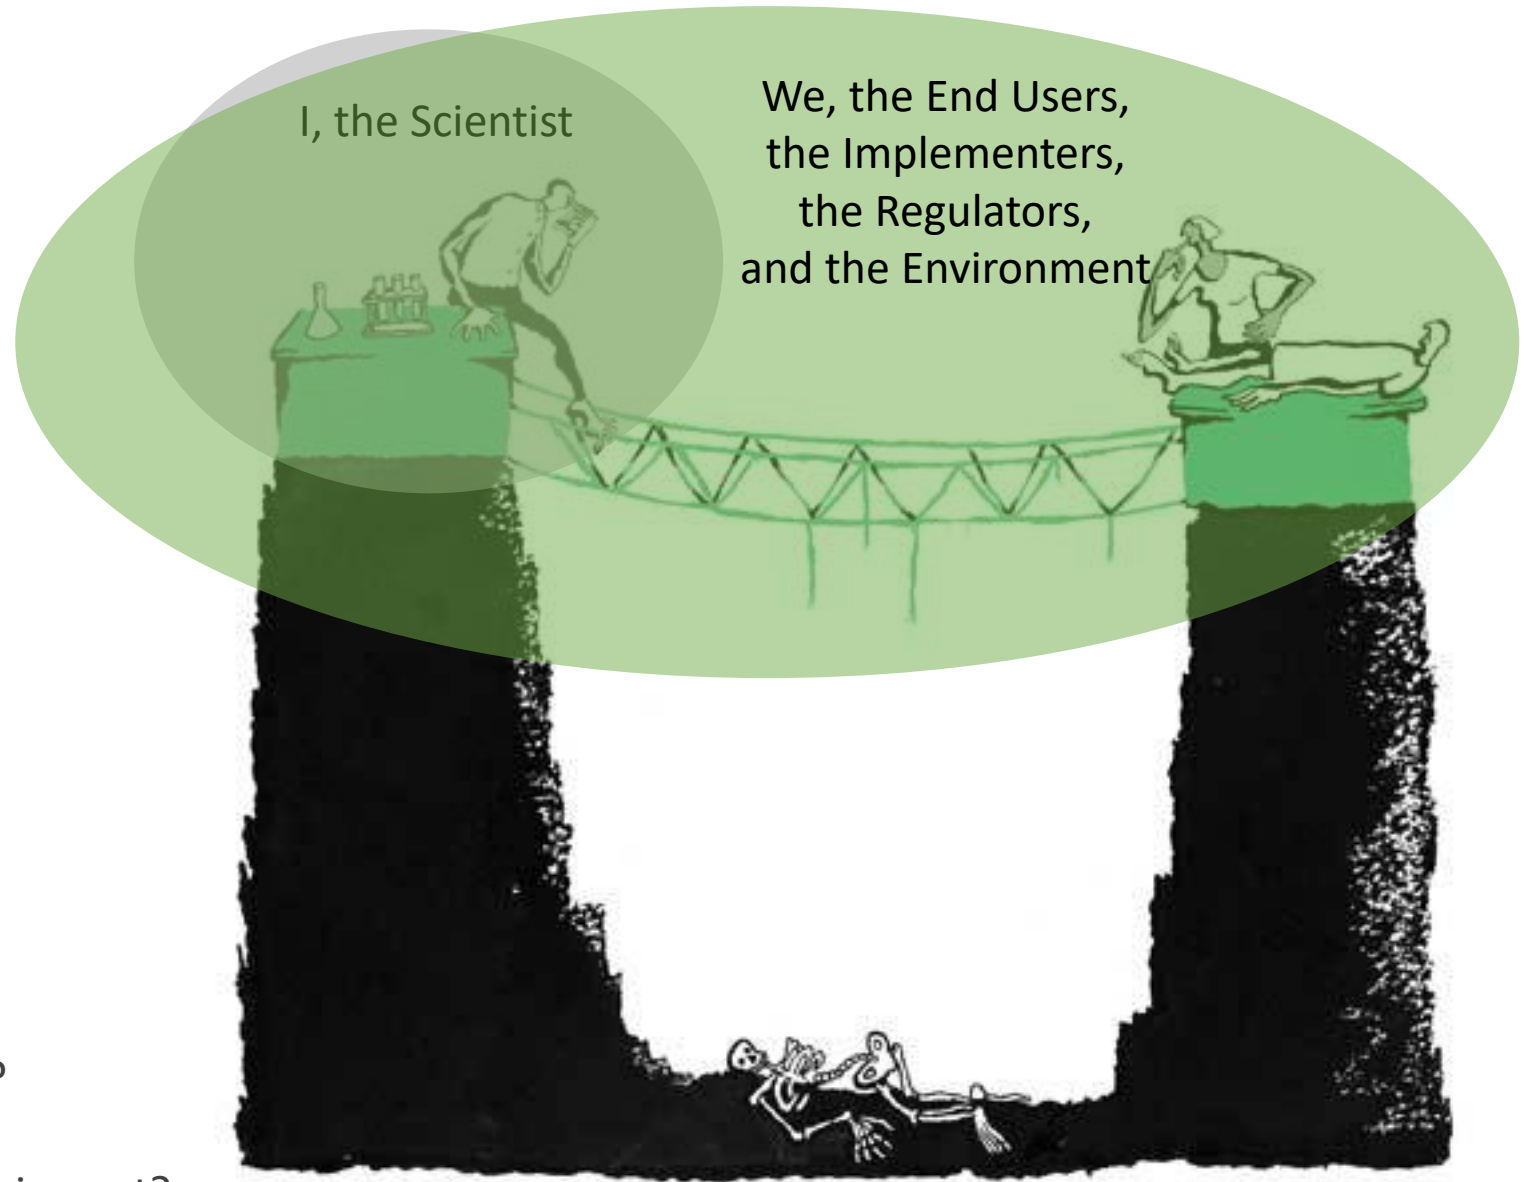

Opportunity: Preserve and forward bio/chemical information from local lab/source to state lab, where local analytical capability does not exist (heavy metals, arsenic, organics)

SUCCESS BEGINS WITH THE END IN MIND

- Are we asking good questions?
- Does this address the bottleneck?
- Is there a consumer benefit?
- What is the environment & safety impact?
- Is the approach efficient & scalable?

Opportunities and challenges are evolving

- Recent advancements in nanotech.
 - CRISPR-Cas9 is commonplace
 - Materials informatics is making leaps and bounds
 - Sensors for water quality tracing (irrigation to packaging)
 - IoT in ag/food has major momentum
- Persistent Challenges
 - Pre pandemic inequity
 - Billions lack safely managed drinking water, sanitation services, food to eat
 - Post-pandemic supply chains
 - Food-Energy-Water-Sanitation-Health (FEWSH) systems

FEWSH: Food-Energy-Water-Sanitation-Health

Systems-level analysis

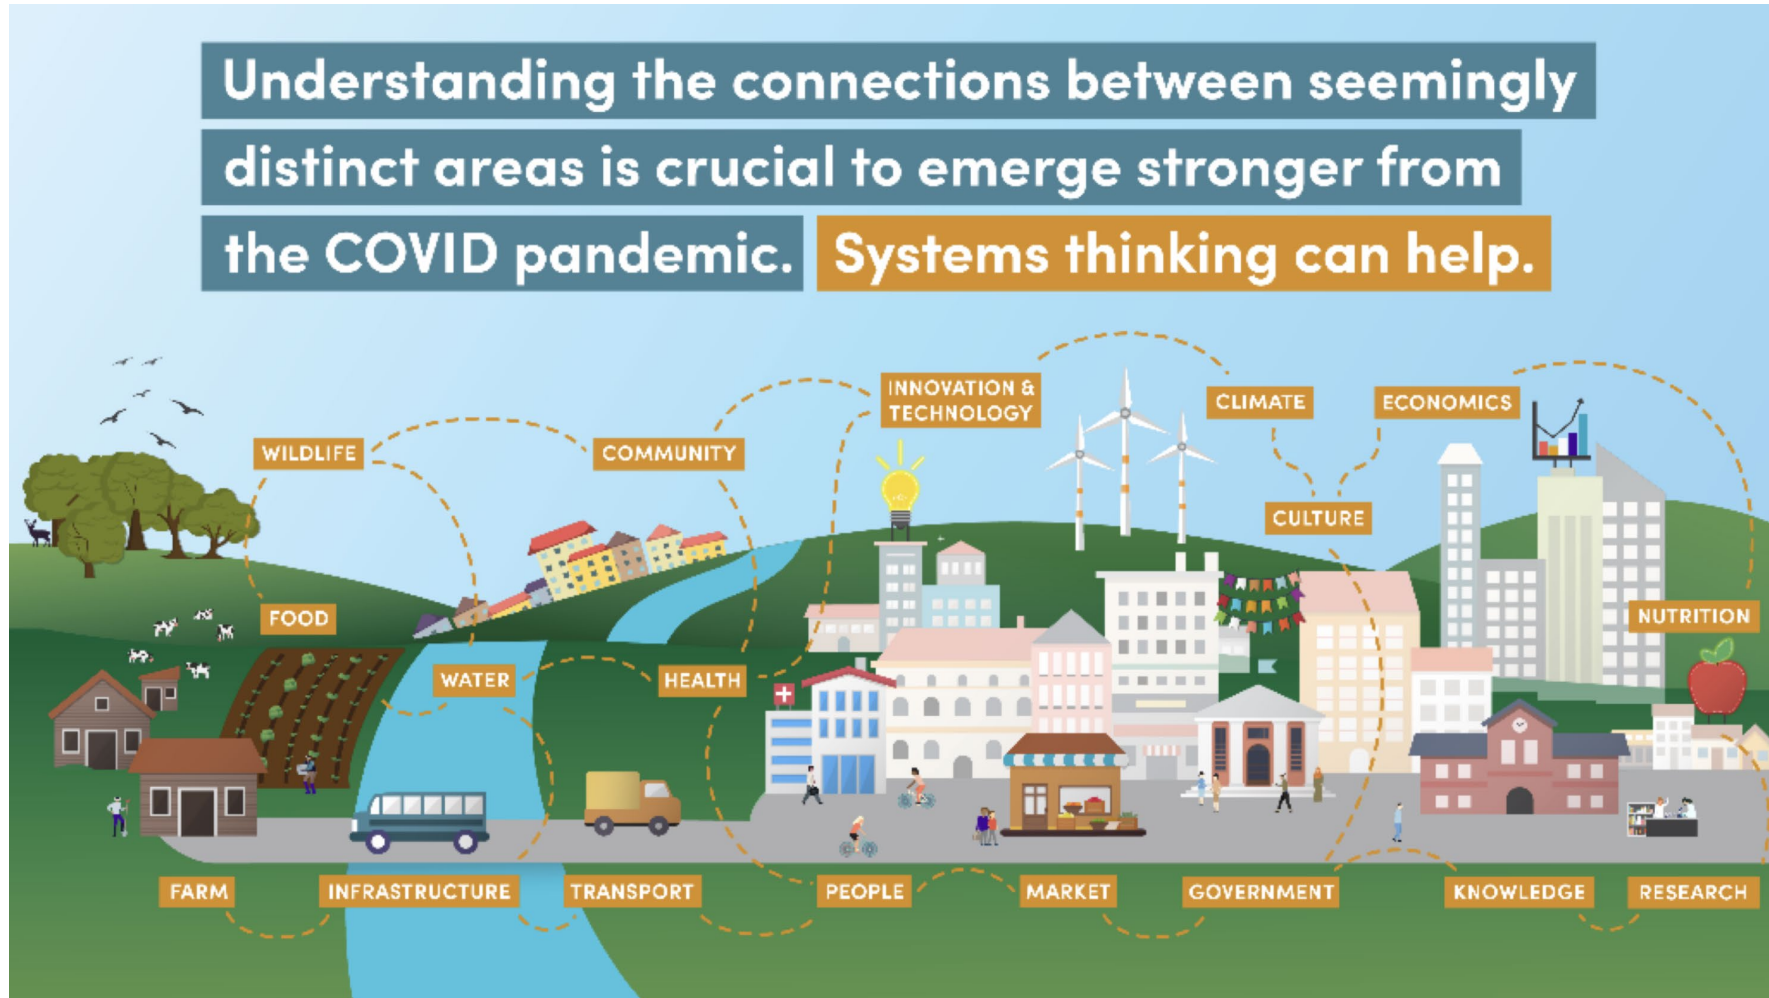

Image: Rockefeller Foundation and EcoAgriculture Partners

Concluding thoughts

- Trust the process
 - May not need to understand all the connections amongst the puzzle pieces
 - Must allow ourselves to be temporarily out of focus to see the problem anew
- Avoid biasing research question(s)
 - Ask questions at the most granular level possible
 - Utilize dynamic focus (multiple times)
- Systems thinking provides rich context
 - Loose connections amongst components reduces risk of catastrophic failure
 - Look for non-obvious relationships (threads)

Concluding/ongoing thoughts

- Different cultures have different values and that needs to be respected and embraced
 - Working with nature instead of trying to outsmart it
 - Food is more than fuel and indulgence to our bodies
 - Nanotechnology portfolios are required to meet diverse stakeholder needs
 - Time is one of the most important factors in technology adoption/appropriation
 - Technologies come fast, but convergence usually don't
 - Technology tradeoffs, *not tradeoffs of stakeholder needs*, necessary for adoption/appropriation
 - Technology tools need to inform users about library of alternatives so that informed decisions can be made
 - If a concerted, and *patient*, effort is made to initiate technology appropriation from the onset, libraries of technologies become available to the user based on mutual *trust*
- 

Thank you for attending!

Please fill out the survey in the chat window or in the browser when the host ends the webinar. A link to the survey will, also, be in the follow-up emails to this webinar.
